for 5 IPs!

The No. 1 Network scanner and vulnerability management solution

GFI LANguard™ is an award-winning solution used by over 20,000 customers that allows you to scan, detect, assess and rectify security vulnerabilities on your network and to secure it with minimal administrative effort. As an administrator, you have to deal separately with problems related to vulnerability issues, patch management and network auditing, at times using multiple products. However, with GFI LANguard these three pillars of vulnerability management are addressed in one package, allowing you to have a complete picture of your network set-up and maintain a secure network state faster and more effectively. list server, server-based auto replies and POP3 downloading.

Cutting-Edge Technology
Competitive Pricing
Over 20,000 Customers

BENEFITS

- Reduces the total cost of ownership (TCO) by centralizing vulnerability scanning, patch management and network auditing
- Over 15,000 vulnerability assessments carried out across your network, including virtual environments
- Automated options help to retain a secure network state with minimal administrative effort
- Network-wide auditing functions provides a complete picture of network's security set-up
- Prevents downtime and business losses due to vulnerability exposure
- #1 Windows commercial security scanner (voted by Nmap users for two years running)

GFI LANguard™

Award-Winning Vulnerability Management Software

Integrated vulnerability management solution

GFI LANguard is an award-winning solution that addresses the three pillars of vulnerability management: security scanning, patch management and network auditing through a single, integrated console. By scanning the entire network, it identifies all possible security issues and, using its extensive reporting functionality, provides you with the tools you need to detect, assess, report and remediate any threats.

- Vulnerability scanning
- Patch management
- Network and software auditing.

Vulnerability scanning

During security audits, over 15,000 vulnerability assessments are made and networks are scanned IP by IP. GFI LANguard gives you:

- The capability to perform multi-platform scans (Windows, Mac OS, Linux) across all environments, including virtual machines
- The ability to analyze your network's security health from a single source of data
- The facility to set-up your own custom vulnerability checks through simple wizard-assisted set-up screens
- The ability to create different types of scans and tests with ease
- A graphical threat level indicator that provides an intuitive, weighted assessment of the vulnerability status of a scanned computer or group of computers
- An extensive, industrial strength vulnerabilities database incorporating OVAL (2,000+ checks) and SANS Top 20 standards
- The ability to check that supported security applications such as anti-virus and anti-spyware software are updated with the latest definition files and are functioning correctly.

Patch management and remediation

This enables you to take action and correct any treats before these can be exploited.

When a scan is complete, GFI LANguard gives you all the functionality and tools you need to effectively address any security issue. You can:

- Automatically deploy microsoft patches and service packs network-wide in 38 different languages
- Define which applications are authorized or unauthorized to be installed on the network
- Perform automatic remediation of unauthorized application
- Easily deploy client software, update custom or non-Microsoft software, virus updates and more.

Patch Management for non-Microsoft Software

GFI LANguard also offers patch management support for non-Microsoft software, enabling administrators to detect, download and deploy missing patches for supported applications in the same way as is done for Microsoft updates. GFI LANguard offers patch management support for many popular applications like Acrobat Reader, Adobe Acrobat, Adobe Flash, Adobe Shockwave Player, Firefox, Thunderbird and others.

Network and software auditing

Once you have scanned for vulnerabilities and patched your systems, you can use the GFI LANguard auditing function to learn everything about your network's security status, including:

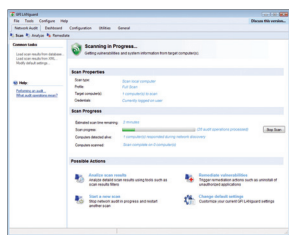

- What USB and other portable devices are connected
- The software that has been installed – both authorized and unauthorized
- Extended hardware auditing facility enabling you to check whether any hardware was added/removed since the last scan
- The number of open shares, open ports, weak passwords in use and users or groups no longer in use
- The security health status of Linux systems on your network.

Powerful reporting functionality

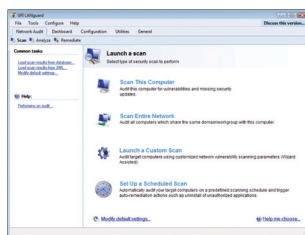

From trend reports for management (ROI) to daily drill-down reports for technical staff, the GFI LANguard ReportPack provides you with the easy-to-view information you need to fully keep abreast of changes to your network's security environment.

Other features:

- Monitoring dashboard that shows summarized results of all scans from the database
- Silent installation support
- Detection of virtual machines and support for virtual machines /virtual environments
- Predefine authentication details
- Automatically checks the password policy for all machines on the network
- Checks for programs that run automatically (potential trojans)
- Finds out if the OS is advertising too much information
- Performs simultaneous scans through the multithread scan engine
- Helps you comply with PCI DSS 1and other regulations.
